

ABSTRACT

An air cargo container includes a base, two side walls, and a rear wall. The side walls each included a curved front edge. A retractable or roll-up door is located between the side walls. The door is extendible from an open position in
5 which the door is retracted or rolled-up, to a closed position in which the door follows the curved front edges of the side walls and terminates at a position adjacent to the base. A support member is attached along the curved front edge of each of the side walls. The support members each include a channel for receiving a cable on a side edge of the retractable door. One or more levers on
10 each support member are rotatable from an open position to a closed position in which the levers secure the cables within the channels in the support members.
